## Midterm Review

CAS CS 132: Geometric Algorithms

## 1 Solving Systems of Linear Equations

Find a solution the following system of linear equations.

$$
\begin{aligned}
x_{1}+x_{2}-x_{3} & =-9 \\
x_{2}-2 x_{3} & =-1 \\
x_{1}+x_{2} & =-10
\end{aligned}
$$

Solution.

## 2 LAA 1.2.18

Determine all values of $h$ such that the following matrix is the augmented matrix of a consistent linear system.
$\left[\begin{array}{ccc}1 & -3 & -2 \\ 5 & h & -7\end{array}\right]$

Solution.

## 3 General Form Solutions

Consider the following system of linear equations.

$$
\begin{aligned}
x_{1}-5 x_{2}-x_{3}-2 x_{4} & =3 \\
x_{3}-2 x_{4} & =11 \\
(-2) x_{3}+5 x_{4} & =-24
\end{aligned}
$$

A. Write down a general form solution which describes the solution set of the following system of linear equations.
B. Write down a different general form solution which describes the same solution set (i.e., one in which a different variable is free).

## Solution.

## 4 LAA 1.3.13

Consider the following matrix $A$ and vector $\mathbf{b}$.

$$
A=\left[\begin{array}{ccc}
1 & -4 & 2 \\
0 & 3 & 5 \\
-2 & 8 & -4
\end{array}\right] \quad \mathbf{b}=\left[\begin{array}{c}
3 \\
-7 \\
h
\end{array}\right]
$$

A. Determine if $\mathbf{b}$ can be written as a linear combination of the columns of $A$ if $h=-3$.
B. For what values of $h$ can $\mathbf{b}$ be written as a linear combination of the columns of $A$.

Solution.

## 5 Intersections of Spans

Consider the following vectors.

$$
\mathbf{v}_{1}=\left[\begin{array}{l}
1 \\
0 \\
0
\end{array}\right] \quad \mathbf{v}_{2}=\left[\begin{array}{l}
0 \\
1 \\
0
\end{array}\right] \quad \mathbf{v}_{3}=\left[\begin{array}{c}
1 \\
2 \\
-1
\end{array}\right] \quad \mathbf{v}_{4}=\left[\begin{array}{l}
0 \\
3 \\
2
\end{array}\right]
$$

Find a nonzero vector which lies in both $\operatorname{span}\left\{\mathbf{v}_{1}, \mathbf{v}_{2}\right\}$ and $\operatorname{span}\left\{\mathbf{v}_{3}, \mathbf{v}_{4}\right\}$.
Solution.

## 6 LAA 1.7.31

Find a nontrivial solution to matrix equation $A \mathbf{x}=\mathbf{0}$ without performing any row reductions. (Hint. What is the relationship between the first two columns and the last column of $A$ ?)

$$
A=\left[\begin{array}{ccc}
2 & 3 & 5 \\
-5 & 1 & -4 \\
-3 & -1 & -4 \\
1 & 0 & 1
\end{array}\right]
$$

Solution.

## 7 Linearly Independent Vectors

Consider three arbitrary vectors

$$
\mathbf{v}=\left[\begin{array}{l}
v_{1} \\
v_{2} \\
v_{3}
\end{array}\right] \quad \mathbf{w}=\left[\begin{array}{l}
w_{1} \\
w_{2} \\
w_{3}
\end{array}\right] \quad \mathbf{u}=\left[\begin{array}{l}
u_{1} \\
u_{2} \\
u_{3}
\end{array}\right]
$$

and suppose that they are linearly independent.
A. What is the maximum number of entries of these vectors which can be 0 ? Note that the solution will be a number between 0 and 9 .
B. What is the minimum number?

In each case provide an example.
Solution.

## 8 Drawing Linear Transformations

Draw the unit square after being transformed by the matrix transformation implemented by

$$
\left[\begin{array}{ll}
1 & 2 \\
3 & 4
\end{array}\right]
$$

Solution.

## 9 Matrices of Linear Transformations

Find the matrix which implemented the following transformation.

$$
\left[\begin{array}{l}
v_{1} \\
v_{2} \\
v_{3} \\
v_{4}
\end{array}\right] \mapsto\left[\begin{array}{c}
v_{2} \\
v_{1} \\
v_{3}+v_{4}
\end{array}\right]
$$

Solution.

## 10 3D Linear Transformations

Considering the transformation $T$ implemented by the following matrix.
$\left[\begin{array}{ccc}\cos 2 & 0 & -\sin 2 \\ 0 & 1 & 0 \\ \sin 2 & 0 & \cos 2\end{array}\right]$

Describe geometrically what $T$ does. Then find a vector $\mathbf{v}$ whose span is not changed by this transformation (i.e., $\operatorname{span}\{\mathbf{v}\}=\operatorname{span}\{T(\mathbf{v})\})$.

Solution.
